

Bordereaux made easy

Strengthen your business with our advanced bordereaux platform

Tide simplifies, streamlines, and standardises complex binder and bordereaux management across underwriting and claims.

Insurers receive a huge number of bordereaux in different formats, but the quality and completeness of the data can vary greatly. As a result, it is often challenging to understand and process information relating to written risks, premiums paid, and claims incurred.

Tide is a centralised and highly automated platform that solves this problem. It maps, cleanses, and validates bordereaux data and then outputs it in a standard format. Automation saves time and money, boosting straight-through processing and eliminating error-prone manual tasks so you can focus on more productive activities.

With Tide, you have complete, consistent, consolidated information. Everything is stored in a single location, making it simple for insurers to extract the data they need to make informed and accurate decisions.

Key Benefits

AUTOMATION

Tide provides end-to-end automation, eliminating manual processing and bottlenecks that add time and expense to bordereaux and increase the risk of errors. Time saved on administrative tasks can be spent on other services that add value to the business.

BETTER DECISION-MAKING

More informed business decisions are possible because data is extracted and analysed in a standard format and there is greater clarity and transparency.

HIGHLY FOCUSED DATA VISIBILITY

Tide has a powerful Business Intelligence (BI) capability. Data can be analysed, either within the Tide BI toolset or imported directly into 'users' warehouse to enable data analytics leading to better business decisions.

INTUITIVE AND USER-FRIENDLY

The user interface makes it easy to handle and process data, and an in-system guide is available to all users.

POWERFUL AND SECURE SAAS DELIVERY

Tide is a cloud-based SaaS platform hosted in Azure. Built from the ground up, it benefits from Azure's 24/7 availability. Tide's in-built security model gives you the option of multi-level (multi-company) access, with specific security at each level per user role, as well as single-level access.

SPEED, VERSATILITY, SCALABILITY

The Inbuilt APIs within Tide can consume data from a variety of different sources. Bordereaux data that has been ingested can be rapidly validated and cleansed, in addition to consuming manual uploads. Tide will scale to accommodate growing volumes of data.

STANDARDISATION AND CONSOLIDATION

Bordereaux can be uploaded to Tide round-the-clock from anywhere in the world, making it easy for insurers to extract and process data. Consolidation is achieved using a questionnaire that filters data submissions into a single, standardised dataset that avoids duplication. Data processing rules can be created to make some datasets mandatory while others can be configured as required.

Cloud hosted
SaaS platform hosted in the Azure cloud, providing security 24/7

Reporting
Powerful operational and MI reporting capabilities including out-of-the-box or bespoke reports

Roadmap
Full details and visibility of upcoming releases

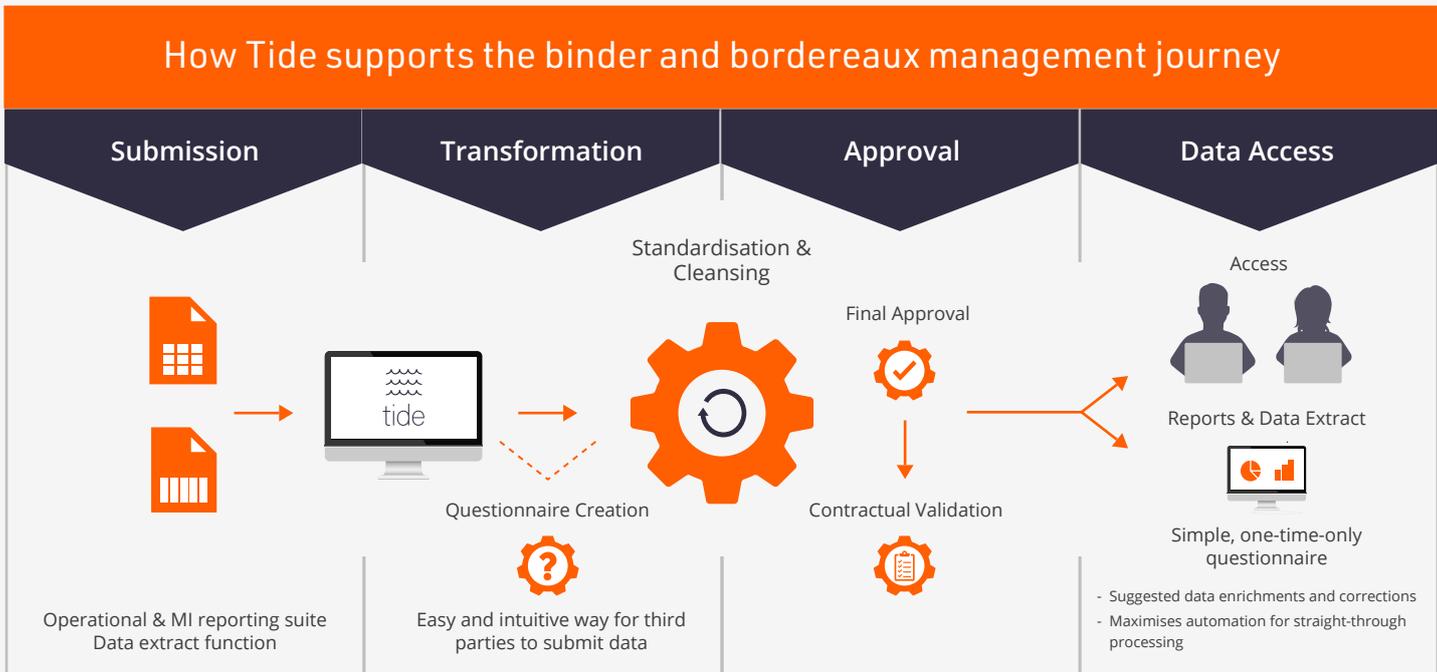

Self service
Manage own company and user access along with data standards and knowledge base

Service assurance
Automated testing suite prior to deployment and regular penetration and performance testing to ensure Tide stays secure

Data security roles
Define the roles for administering, processing and approving bordereaux
